A/B testing
  canary releases, Considerations When Sending Models to Production
  considerations in MLOps context, A/B testing
  of new and existing model versions, The Feedback Loop
  performance monitoring for marketing recommendation engine, Monitoring Performance
  for recommendation engines using collaborative filtering, The Role of Machine Learning
  using in online evaluation of models, Online Evaluation, A/B testing
accountability
  GxP guidelines focus on, Pharmaceutical Regulation in the US: GxP
  in Responsible AI, MLOps for Responsible AI, The Emergence of Responsible AI
accuracy, precision, and recall, Prepare for Production
  metrics collected in preproduction model testing, Key Testing Considerations
adversarial attacks, Adversarial Attacks
AI, The Emergence of Responsible AI
  (see also Responsible AI)
  new wave of AI-specific regulations, The New Wave of AI-Specific Regulations-The Emergence of Responsible AI
  Responsible AI, MLOps for, MLOps for Responsible AI
AIOps versus MLOps, Why Now and Challenges
algorithms (machine learning), A Primer on Machine Learning, Required Components
  computing power considerations, Different ML Algorithms, Different MLOps Challenges
  MLOps considerations by algorithm type, Different ML Algorithms, Different MLOps Challenges
  online learning, How Often Should Models Be Retrained?

requirement for tabular input data, Feature Engineering Techniques
smoothness of predicted curve, Modeling
analytics use cases, understanding and classifying, Step 1: Understand and Classify the Analytics Use Cases
anomaly detection, Model Misbehavior
anonymizing or pseudo-anonymizing data, Data Governance
Apache Spark, Categories of Model Deployment
APIs
marketing recommendation engine API endpoints, Pipeline Structure and Deployment Strategy
REST API for model-as-a-service or live-scoring model, Model Deployment Types and Contents
ARIMA (autoregressive integrated moving average), Modeling, Monitoring
artifacts (ML), Building ML Artifacts-The Testing Pipeline
assumptions (model), Version Management and Reproducibility
auditability, The New Wave of AI-Specific Regulations, Element 4: Model Management at Scale
aiding with QA for machine learning, Reproducibility and Auditability
and reproducibility, Reproducibility and Auditability
automation
automated feature selection, How Feature Selection Impacts MLOps Strategy
automated model deployment, Model Deployment Requirements
automated model documentation, Responsible AI
automated model packaging and delivery, People of MLOps, Data Scientists
automated reporting tools on all models, People of MLOps
automatically controlling models, marketing recommendation system, Option to Automatically Control Models
in experimentation during model development, Experimentation
feedback loop, Deploy to Production
of tests in testing pipeline, The Testing Pipeline
of versioning and reproducibility tasks, Version Management and Reproducibility

B

batch scoring, Categories of Model Deployment
volume of data becoming too large, distributing computation, Scaling Deployments
Bayesian tests, The Feedback Loop
biases
analyzing models for fairness, Key Testing Considerations
inappropriate biases in models, Data Governance
introduced by ground truth monitoring, Ground Truth Evaluation
in ML black box judgments, Who Decides What Governance the Organization Needs?
model bias considerations in consumer credit risk management, Model Bias Considerations
reputational risk due to, The Origins of ML Model Risk
Responsible AI position on, Element 2: Bias
sample selection bias, Example Causes of Data Drift
tuning bias/variance trade-off, Experimentation
black box models, Impact of Responsible AI on Modeling
blue-green deployment, Model Deployment Types and Contents, Considerations When Sending Models to Production
bounds for retraining frequency, How Often Should Models Be Retrained?
business concerns in monitoring ML models, Business Concerns
business decision modeling, Subject Matter Experts
business metrics for model performance monitoring, Ground Truth Evaluation, Univariate statistical tests
business objectives, establishing for ML model, Establishing Business Objectives
business use case, consumer credit risk management application, Background: The Business Use Case

C

canary releases, Considerations When Sending Models to Production
CCPA (California Consumer Privacy Act), Governance, GDPR and CCPA Data Privacy Regulations

champion/challenger, Key Testing Considerations, Champion/Challenger
Chi-squared test, Univariate statistical tests
CI/CD pipelines, CI/CD Pipelines-CI/CD Pipelines
    continuous delivery for end-to-end machine learning process, The Feedback Loop
    DevOps role in managing, DevOps
    for different models, Scaling Deployments
    Jenkins build system, The Testing Pipeline
    ML artifacts in, What's in an ML Artifact?
    robust, for model deployments, Model Deployment Requirements
collaborative filtering, The Role of Machine Learning
compression techniques, use in model definition optimization, Performance considerations
computational metrics from model testing, Key Testing Considerations
computing power
    ML model development and, Different ML Algorithms, Different MLOps Challenges
    requred for inference on ML models, Final Thoughts on Runtime Environments
concept drift, Input Drift Detection
conformal prediction, Model Misbehavior
consumer credit risk management, MLOps in Practice: Consumer Credit Risk Management-Closing Thoughts
    business use case, Background: The Business Use Case
        problem definition and data acquisition, Background: The Business Use Case
    deploying model to production, Deploy to Production
    model development, Model Development
        bias considerations, Model Bias Considerations
    preparing model for production, Prepare for Production
consumption forecast for power grid, MLOps in Practice: Consumption Forecast-Closing Thoughts
    data collection, Data Collection-Data Collection
    deployment of models, Deployment
    implementation, Implementation-Modeling
        modeling, Modeling

monitoring, Monitoring
power systems, Power Systems-Power Systems
problem definition, using machine learning or not, Problem Definition: Machine Learning, or Not Machine Learning?-Spatial and Temporal Resolution
spatial and temporal resolution, Spatial and Temporal Resolution
containerization, Containerization-Containerization
solving problems of dependencies in ML model deployments, Model Deployment Types and Contents
continuous integration and continuous delivery (see CI/CD pipelines)
costs
for algorithms that train themselves, How Often Should Models Be Retrained?
for retraining models versus performance improvement, How Often Should Models Be Retrained?
cross-trained models, How Often Should Models Be Retrained?
curse of dimensionality, Model Misbehavior
customizability, marketing recommendation engine model, Scalability and Customizability

D

dark launch, Champion/Challenger
(see also champion/challenger)
data
collection for consumption forecast for power grid, Data Collection-Data Collection
considerations in Responsible AI, Element 1: Data
customer data, preparation for marketing recommendation engine, Data Preparation
processing for consumption forecast system, Implementation
reproducibility, Version Management and Reproducibility
data access before validation and launch to production, Data Access Before Validation and Launch to Production
data architects, Machine Learning Architect
data cleansing, Feature Engineering and Selection

data drift, Input Drift Detection
for consumer credit risk management model, Prepare for Production
example causes of, Example Causes of Data Drift
data engineers, Data Engineers
data exploration, Data Exploration
data governance, Data Governance
questions for ML model data sources, Data Sources and Exploratory Data Analysis
data pipeline structure for recommendation engine project, Pipeline Structure and Deployment Strategy
data privacy, Governance, Current Regulations Driving MLOps Governance
GDPR and CCPA regulations on, Governance, GDPR and CCPA Data Privacy Regulations
data scientists, Data Scientists-Data Scientists
collaboration with SMEs in ML model life cycle, Subject Matter Experts
concerns in ML model monitoring, Data Scientist Concerns
ground truth, Ground truth
input drift, Input drift
role in and needs from MLOps, Data Scientists
role in machine learning model life cycle, Data Scientists
data sources for machine learning models, Data Sources and Exploratory Data Analysis
DataOps, Defining MLOps and Its Challenges
decision modeling (business), Subject Matter Experts
decision-making processes, statistically driven, Who Decides What Governance the Organization Needs?
deep learning, Different ML Algorithms, Different MLOps Challenges, Feature Engineering Techniques, Impact of Responsible AI on Modeling
degradation of model performance
common approaches to discovering, Data Scientist Concerns
understanding, Understanding Model Degradation-Input Drift Detection
delivery, Deployment Strategies

(see also CI/CD pipelines)
continuous delivery versus deployment, Deployment Strategies
dependencies
partial dependency plots, Responsible AI
on production environment, reducing, Model Deployment Types and Contents
deployment strategies, Deployment Strategies-Maintenance in Production
categories of model deployment, Categories of Model Deployment
concepts and terminology, Deployment Strategies
considerations in sending models to production, Considerations When Sending Models to Production
maintenance of models in production, Maintenance in Production
deployments
broader model deployment, greater risks from, Model Risk Mitigation
consumption forecast models, Deployment
deploying to production, Deploying to Production-Closing Thoughts
building ML artifacts, Building ML Artifacts-The Testing Pipeline
CI/CD pipelines, CI/CD Pipelines
consumer credit risk management model, Deploy to Production
containerization, Containerization-Containerization
scaling deployments, Scaling Deployments-Requirements and Challenges
strategies for, Deployment Strategies-Maintenance in Production
deployment, defined, Deployment Strategies
marketing recommendation engine model, Model Training and Deployment-Ability to Turn Recommendations On and Off
model deployment types and contents, Model Deployment Types and Contents
model deploymnt requirements, Model Deployment Requirements
development environments, adaptation to production environments, Adaptation from Development to Production Environments-Performance considerations
DevOps, DevOps
concerns in ML model monitoring, DevOps Concerns

MLOps and, Defining MLOps and Its Challenges
monitoring of ML models, Monitoring and Feedback Loop
role in and needs from MLOps, DevOps
role in machine learning model life cycle, DevOps
DI (Data Integrity), Pharmaceutical Regulation in the US: GxP
dimensionality, curse of, Model Misbehavior
dimensioning constraints on model development, Impact of Responsible AI on Modeling
disaggregations of data, Implementation, Monitoring
distances between probability distributions, Prepare for Production
distillation (model), Performance considerations
distributed computation, Scaling Deployments
distribution of data, Input Drift Detection
divergence between training and testing phases, Drift Detection in Practice
Docker, Containerization
deployment of models through, Deploy to Production
using Kubernetes with, Containerization
documentation of model development, Responsible AI
domain knowledge, importance in data exploration for models, Data Exploration
domains
domain classsifier, Domain classifier
model retraining frequency and, How Often Should Models Be Retrained?
drift, Input Drift Detection
(see also input drift)
detection in practice, Drift Detection in Practice-Interpretation of results
example causes of data drift, Example Causes of Data Drift
input drift detection techniques, Input Drift Detection Techniques
measuring for consumer credit risk assessment model, Prepare for Production
monitoring, Monitoring
monitoring and mitigation measures, Closing Thoughts

E

EDA (exploratory data analysis), Data Sources and Exploratory Data Analysis, Data Sources and Exploratory Data Analysis, Data Exploration
effiencyency, data scientists' need for from MLOps, Data Scientists
elastic systems, Scaling Deployments
embedded models, Model Deployment Types and Contents
embeddings, Feature Engineering Techniques
engaging and educating groups responsible for governance, Step 7: Engage and Educate
environmental, social, and governance (ESG) performance indicators, Governance
environments
  changing rapidly, multiplying model risks, Changing Environments
  information needed by data scientists, Cross-Checking Model Behavior
  providing exact description for model version management, Containerization
  reproducibility and, Version Management and Reproducibility
ethical position, establishing in MLOps, Step 2: Establish an Ethical Position
EU
  General Data Protection Regulation (GDPR), Governance, GDPR and CCPA Data Privacy Regulations
  key requirements for trustworthy AI applications, The New Wave of AI-Specific Regulations
evaluation datasets, Required Components
experimentation in model development, Experimentation-Experimentation
  impacts on MLOps strategy, Experimentation
  marketing recommendation engines, Design and Manage Experiments
explainability, Responsible AI
  for decisions made by ML models affecting humans, Impact of Responsible AI on Modeling
  in Responsible AI, The Emergence of Responsible AI

exploratory data analysis (see EDA)

F

Facebook-Cambridge Analytica affair, Who Decides What Governance the Organization Needs?
fairness
reassuring public that ML is fair, Who Decides What Governance the Organization Needs?
requirements having dimensioning constraints on model development, Impact of Responsible AI on Modeling
subpopulation analysis and model fairness, Key Testing Considerations
feature drift, Input Drift Detection
feature stores, How Feature Selection Impacts MLOps Strategy
features, Data Sources and Exploratory Data Analysis
controlling feature-value intervals, Model Misbehavior
drift attributed to, use in mitigating impact of drift, Interpretation of results
engineering and selection, Feature Engineering and Selection, Feature Engineering and Selection-How Feature Selection Impacts MLOps Strategy
feature engineering techniques, Feature Engineering Techniques
impacts of feature selection on MLOps strategy, How Feature Selection Impacts MLOps Strategy
statistical test on data from source and target distribution, Univariate statistical tests
federated learning approach to model retraining, The Feedback Loop
feedback loop, The Feedback Loop-Closing Thoughts
automating or not, Deploy to Production
infrastructure, main components of, The Feedback Loop
logging, Logging
model evaluation, Model Evaluation-Model evaluation store
logical model, Logical model
model evaluation store, Model evaluation store

online evaluation of models in production, Online Evaluation-A/B testing
A/B testing, A/B testing
champion/challenger, Champion/Challenger
financial crisis of 2007-2008, Financial Model Risk Management Regulation
financial model risk management regulation, Financial Model Risk Management Regulation
financial risk management techniques, Model Development
Flask framework, Model Deployment Requirements
forecasting, MLOps in Practice: Consumption Forecast
(see also consumption forecast for power grid)
forecasting techniques by use case, Problem Definition: Machine Learning, or Not Machine Learning?
spatial and temporal resolution of consumption, Spatial and Temporal Resolution

G

GAM (generalized additive models), Modeling
GDPR (General Data Protection Regulation), Governance, GDPR and CCPA Data Privacy Regulations
generalization capacity (models), In Theory
Git, Building ML Artifacts
Google, smartphone keyboard software, GBoard, The Feedback Loop
governance, Governance-Process Governance, Model Governance-Closing Thoughts
AI-specific regulations, new wave of, The New Wave of AI-Specific Regulations-The New Wave of AI-Specific Regulations
status of AI governance initiatives worldwide, The New Wave of AI-Specific Regulations
application to MLOps, Governance
data governance, Data Governance
process governance, Process Governance
critical role in machine learning security, Other Vulnerabilities
current regulations driving MLOps governance, Current Regulations Driving MLOps Governance-GDPR and CCPA Data

Privacy Regulations
financial model risk management, Financial Model Risk Management Regulation
GDPR and CCPA data privacy regulations, GDPR and CCPA Data Privacy Regulations
pharmaceutical regulation in US, GxP, Pharmaceutical Regulation in the US: GxP
key elements of Responsible AI, The Emergence of Responsible AI-Element 5: Governance
bias, Element 2: Bias
data, Element 1: Data
governance techniques, Element 5: Governance
inclusiveness, Element 3: Inclusiveness
model management at scale, Element 4: Model Management at Scale
matching with risk level, Matching Governance with Risk Level
template for MLOps, A Template for MLOps Governance-Step 8: Monitor and Refine
determining governance policies, Step 4: Determine Governance Policies
engaging end educating, Step 7: Engage and Educate
establishing an ethical position, Step 2: Establish an Ethical Position
establishing responsibilities, Step 3: Establish Responsibilities
integrating governance policies into MLOps process, Step 5: Integrate Policies into the MLOps Process
monitoring and refining governance, Step 8: Monitor and Refine
selecting tools for centralized governance management, Step 6: Select the Tools for Centralized Governance Management
understanding/classifying analytics use cases, Step 1: Understand and Classify the Analytics Use Cases
who decides on organization needs, Who Decides What Governance the Organization Needs?
gradient boosting algorithms, Model Development
ground truth, Ground truth
evaluation of, in monitoring of performance degradation, Ground Truth Evaluation

GxP pharmaceutical regulations in US, Pharmaceutical Regulation in the US: GxP

H

health checks, Maintenance in Production
health diagnosis or prediction example, In Theory
high bias model (underfitting), Experimentation
high variance model (overfitting), Experimentation
historizing data, Implementation
house price example, model prediction and generalization, In Theory
human-centered approach, The Emergence of Responsible AI
human-in-command, Ability to Turn Recommendations On and Off
human-in-the-loop (HITL), Element 3: Inclusiveness
hyperparameters of ML algorithms, Required Components

I

impact coding, Feature Engineering Techniques
implementation, reproducibility of models and, Version Management and Reproducibility
inclusiveness, Element 3: Inclusiveness
individual conditional expectation (ICE) computations, Impact of Responsible AI on Modeling
inference, computing power required for, Final Thoughts on Runtime Environments
input drift, Input drift
  detection of, Input Drift Detection
  detection techniques, Input Drift Detection Techniques
    domain classifier, Domain classifier
    interpretation of results, Interpretation of results
    univariate statistical tests, Input Drift Detection Techniques
  model retraining motivated by, Iteration
integration, Deployment Strategies
  (see also CI/CD pipelines)
intentionality, Responsible AI, MLOps for Responsible AI, The Emergence of Responsible AI

interactions between models, risks generated by, Interactions Between Models
interpretability (ML), bias detection through, Element 2: Bias
iterations of ML models, Iteration
feedback loop, The Feedback Loop
iterating on model deployed to millions of devices, The Feedback Loop

J

Java-based environment, model developed in Python, Tooling considerations
Jenkins build system, The Testing Pipeline

K

Kolmogorov-Smirnov test, Univariate statistical tests, Prepare for Production
KPIs (key performance indicators), Establishing Business Objectives, Matching Governance with Risk Level
in business scoping, Step 5: Integrate Policies into the MLOps Process
for governance, Step 8: Monitor and Refine
measurement of, Data Sources and Exploratory Data Analysis
monitoring for deployed ML models, Business Concerns
subject matter experts contributing, Subject Matter Experts
tracking model performance against, Step 6: Select the Tools for Centralized Governance Management
training different models for different KPIs, Option to Automatically Control Models
Kubernetes, Model Deployment Types and Contents, Containerization
autoscaling properties, Scaling Deployments
using with Spark, Scaling Deployments

L

labeled sample subset, problems in ground truth monitoring, Ground Truth Evaluation

latency
metrics on, collection in preproduction model testing, Key Testing Considerations
model conversions and, Performance considerations
linear algorithms, Different ML Algorithms, Different MLOps Challenges
linear models, advanced, Model Development
Linux cgroups, Model Deployment Requirements
live-scoring model, Model Deployment Types and Contents
logging
activity logging of deployed model, Deploy to Production
component in ML feedback loop, Logging
using to generate centralized datasets for use by model designer, Requirements and Challenges
logical model, Logical model
comparing performance between different versions, Model evaluation store
versioning evolution of, Model evaluation store
LTSM (long short-term memory) neural networks, Modeling

M

machine learning, Developing Models
(see also models)
continuous delivery for end-to-end process, The Feedback Loop

scaling inference on models, Final Thoughts on Runtime Environments
scikit-learn, Risk Mitigation
models developed with, adpatation to producton environments, Tooling considerations
security in machine learning, Machine Learning Security-Other Vulnerabilities
adversarial attacks, Adversarial Attacks
other vulnerabilities, Other Vulnerabilities
selection bias, Example Causes of Data Drift
settings, reproducibility and, Version Management and Reproducibility
shadow testing, Online Evaluation
(see also champion/challenger)
of new model version deployed alongside existing model, The Feedback Loop
Shapley values, Responsible AI, Impact of Responsible AI on Modeling, Model Development
sharding, Categories of Model Deployment
SMEs (see subject matter experts)
software engineers, Software Engineers
role in and needs from MLOps, Software Engineers

role in machine learning model life cycle, Software Engineers
Spark, Scaling Deployments
spatial aggregations of data, Implementation
spatial and temporal resolution, forecast uncertainty and, Spatial and Temporal Resolution
statistics
from null hypothesis to p-values, Ground Truth Evaluation
statistical metrics for model performance monitoring, Ground Truth Evaluation
statistical results on model testing, Key Testing Considerations
statistically driven decision-making processes in ML, Who Decides What Governance the Organization Needs?
univariate statistical tests, Input Drift Detection Techniques
stochasticity, Modeling
subject matter experts (SMEs), Subject Matter Experts-Subject Matter Experts
role in and needs from MLOps, Subject Matter Experts
role in machine learning model life cycle, Subject Matter Experts
subpopulations
analyses of, Responsible AI
analysis and model fairness, Key Testing Considerations
investing model performance for in consumer credit risk management, Model Bias Considerations
statistical tests on results in preproduction model testing, Key Testing Considerations
supervised learning, Required Components

T

technical debt in machine learning, How Feature Selection Impacts MLOps Strategy
temporal aggegrations of data, Implementation
testing
key testing considerations, Key Testing Considerations
for models using self-training algorithm, How Often Should Models Be Retrained?
testing pipeline for ML artifacts, The Testing Pipeline

tools
considerations in adaptation from development to production environments, Tooling considerations
selecting for centralized governance management, Step 6: Select the Tools for Centralized Governance Management
traceability in pharmaceutical industry, Pharmaceutical Regulation in the US: GxP
training data, A Primer on Machine Learning, Required Components
adversarial attacks on, Adversarial Attacks
data governance concerns, Data Governance
keeping up to date for deployed models, Data Scientist Concerns
non-stationary environment, Example Causes of Data Drift
quality of, determining model performance, Monitoring and Feedback Loop
training models, Training and Evaluation
automation in, Experimentation
deciding how often to retrain models, How Often Should Models Be Retrained?-How Often Should Models Be Retrained?
marketing recommendation engine model, Model Training and Deployment-Ability to Turn Recommendations On and Off
retraining existing model with latest training data, Iteration
transfer learning, Feature Engineering Techniques
transparency
data scientists' need for from MLOps, Data Scientists
subject matter experts, role in MLOps, Subject Matter Experts
transparent strategies for machine learning, Closing Thoughts
tree-based algorithms, Different ML Algorithms, Different MLOps Challenges
trust
EU's requirements for trustworthy AI applications, The New Wave of AI-Specific Regulations
importance to consumers and businesses, Governance
Tweedie distribution, Model Development
Twitter chatbot by Microsoft, Adversarial Attacks
two-stage models with offset, Model Development

U

U.S. Food and Drug Administration (FDA), Pharmaceutical Regulation in the US: GxP
UCI Wine Quality dataset, Input Drift Detection
UK Prudential Regulation Authority's (PRA) regulation, Financial Model Risk Management Regulation
underfitting, Experimentation
univariate statistical tests, Input Drift Detection Techniques
updating models, Updating Models

V

validation
data access before model validation, Data Access Before Validation and Launch to Production
model for consumer credit risk management, Model Bias Considerations
purpose of model validation, The Purpose of Model Validation
testing on recent production data from models, The Testing Pipeline
variance in models, Experimentation
version control systems, central, Building ML Artifacts
version management, Containerization
version management and reproducibility, Reproducibility, Version Management and Reproducibility-Version Management and Reproducibility
VMs (virtual machines), containers versus, Containerization

W

Wasserstein distance, Prepare for Production
what-if analysis, Responsible AI

X

XGBoost algorithm, Model Development
